i I am a **freelance Senior Full-Stack & AI Engineer** focused on **AI: LLM integration, RAG and AI-assisted automation** – from architecture through to **stable production operation**.

My guiding principle: anything done manually twice gets automated. That applies to my clients' processes just as much as to my own work. In **logistics**, a route management system I built saves up to **1,000 hours per employee per year** through automated document processes; in **retail**, up to **40 hours of administrative work per month**; at a **notary's office**, clients' phone enquiries drop by up to **70 %**.

My own development follows the same principle: I work with **modern agentic coding and AI engineering workflows** – **spec-driven, AI-assisted and with automated tests and reviews**. That gives me **high delivery speed at consistent quality**, with no compromise on **maintainability, traceability and stability**.

I'm at home in both backend (NestJS · Node.js · FastAPI) and frontend (Next.js · React · Angular) – open to full-stack, backend-only or frontend-only work.

I work **independently, remotely and asynchronously**. A clear goal is enough – I structure the path there myself. **I document decisions, code arrives tested and ready for review**, and I raise technical risks early. Communication in **German and English**.

More than **7 years of experience** in **LegalTech, HealthTech, e-commerce, EdTech and logistics** – both as part of a **20-strong engineering team** on an **AI-assisted LegalTech platform with more than 3,000 customers** and as the **sole developer responsible for architecture, operations and further development**.

04/2025 – PRESENT · 16 MONTHS

01

BESCHEIDKLAR — AI-Assisted LegalTech SaaS PlatformRole: Founder & CTO Client: [Own product](#) ↗↗ Project on sequenz.io

ROLE Founder & CTO	TEAM Solo · own product (side project)	LOCATION Lower Saxony, Germany · Remote
LANGUAGE German	WEBSITE bescheidklar.de ↗	METHODOLOGY Direct product ownership

RESPONSIBILITIES

- Built a modular, service-oriented architecture for the claimant-facing frontend, the law firm area and the regional licensing model (**Stripe**).
- **AI pre-assessment pipeline** for official notices and terminations (in progress): extraction → deadline check → plausibility and prospects assessment, with the case prepared in structured form.
- Automated, **GDPR-compliant** handover of qualified leads including uploaded documents to matching specialists (lawyers, law clinics).
- **RAG-based** guidance section with articles and recommended next steps for those affected.
- Coverage of several legal areas (civil, social and employment law) through an extensible, multilingual and low-barrier web interface.
- End-to-end responsibility for the tech stack, hosting on EU infrastructure and a secure-by-design compliance concept (**EU AI Act**, **GDPR**, **German Legal Services Act**).
- Type-safe end-to-end data flows (**TypeScript**, **DTOs**, **Zod**) with automated **CI/CD** delivery (**GitHub Actions**, **Docker**), monitoring and error tracking (**Datadog**) and test coverage (**Vitest**, **Jest**, **Playwright**).
- Close collaboration in code reviews and use of AI-assisted tools (**Claude Code**, **Cursor AI**, **Code Rabbit**) to safeguard quality and development pace.

BESCHIEDKLAR — AI-ASSISTED LEGALTECH SAAS PLATFORM — CONTINUED

RESULTS

- **MVP** delivered single-handedly — architecture, platform and operation on EU infrastructure from one source. The remaining scope is in progress.
- Compliance built into the product design rather than retrofitted: the **EU AI Act**, the GDPR and the limits of the **German Legal Services Act** were part of the plan from the start.
- Delivery fully automated: tests, build and container deployment run through **GitHub Actions**, and production errors surface through **Datadog** — releases with no manual step, even as a one-person team.
- Outlook: up to 10,000 automated pre-assessments per month and up to **80 %** less manual case intake.
- Outlook: a predictable inflow of pre-qualified cases for partner law firms instead of costly manual initial assessment.

02

Role: Senior Full-Stack Engineer (AI feature integration) **Client:** [Manifest Law](#) ↗

Testimonial

➤ Project on sequenz.io

ROLE Senior Full-Stack Engineer (AI feature integration)	TEAM ~20 engineers across 4 teams · platform, AI, full-stack	LOCATION New York, USA · Remote
LANGUAGE English · EU & US	WEBSITE manifestlaw.com ↗	METHODOLOGY Scrum · autonomous · with PM and design

- Production **AI enrichment** of initial legal consultation leads (**HubSpot**, **Cal.com**, **Bluedot**): recordings are transcribed, passed to the OpenAI integration through a **webhook** and a **BullMQ** queue, and written back into the core systems in structured form — the basis for more efficient case handling.
- **AI-assisted evidence processing**: uploaded case documents are analysed, classified and consistently named automatically.
- Consolidation of four portals (**B2B**, **B2C**, lawyer, ops) into a single "**B2X**" portal — in a team of four engineers, focusing on the full-stack migration of the **B2B** and ops areas.
- Introduction of application-wide event tracking (**Amplitude**) as the data foundation for product and data analytics.
- Resilience of the **event-driven** services (**NestJS**, **BullMQ**): retry strategies, idempotency and defined behaviour when the AI and transcription services fail.
- Delivery within a monorepo with clearly scoped feature modules, so it can be split into **microservices** quickly later on, with type-safe interfaces (**TypeScript**, **DTOs**) and automated tests (**Jest**, **Playwright**) in the **CI/CD** pipeline.
- Close collaboration in code reviews and use of AI-assisted tools (**Claude Code**, **Cursor AI**, **Code Rabbit**) to safeguard quality and development pace.

MANIFEST OS — AI-ASSISTED IMMIGRATION PLATFORM — CONTINUED

RESULTS

- AI features running in production: consultation leads are enriched without manual rework — summary, next steps and ownership sit right on the case in the system.
- Application-wide event tracking established as a shared data foundation for product and data analytics.
- Refactoring initiatives in the migrated **B2B** and ops areas: existing structures simplified and geared towards better maintainability.
- According to the provider: more than 3,000 clients, 150+ corporate programmes and up to **15 %** higher approval rates than the USCIS average (a team result).

SOCIAL MEDIA / MOBILE APP

11/2025 – 12/2025 · 2 MONTHS

03

RateUp — Rating App for Web, iOS and Android

Role: Sole Developer · Full-Stack Client: [Krutzfeld Tech GmbH](#) ↗[↗ Project on sequenz.io](#)

ROLE Sole Developer · Full-Stack	TEAM Solo · client project	LOCATION Zurich, Switzerland · Remote
LANGUAGE German	WEBSITE krutzfeld.tech ↗	METHODOLOGY Self-directed

RESPONSIBILITIES

- Social media rating app from a single **ionic/Angular** codebase — on the web and as native builds for iOS and Android.
- Sign-up, login and onboarding including profile creation (**Firestore Authentication**), secured through **Firestore security rules**.
- Social media feed with filters, own posts and media upload (**Cloud Firestore, Cloud Storage**).
- Delivery of the web version through **Firestore Hosting** with a **CI/CD** pipeline (**GitHub Actions**).
- A maintainable codebase for handover: clearly layered structure, reusable components, type-safe models and a consistent clean-code style (**SOLID**).

RATEUP — RATING APP FOR WEB, IOS AND ANDROID — CONTINUED**RESULTS**

- Finished product handed over to the client — running as a cross-platform app on the web and as a native app on iOS and Android from one shared codebase.
- Built entirely on **Firebase**: authentication, data storage, media storage and delivery — access runs straight through the **Firebase** SDK, with no server layer of its own.
- A codebase ready for handover: consistent structure, reusable components and type safety throughout — the client's team can carry on without a ramp-up hurdle.
- One revision, three platforms: web deployment through **Firebase** Hosting, iOS and Android builds from the same codebase.
- Built on an existing clickable prototype and taken to a product ready for handover in around two months.

IOT / CONSUMER ELECTRONICS

08/2025 – 09/2025 · 2 MONTHS

04 AITOI — Interactive IoT Toy (MVP)

Role: Frontend Engineer Client: AITOI [Testimonial](#) [Project on sequenz.io](#)

ROLE Frontend Engineer	TEAM 3 people · frontend, embedded/hardware, lead	LOCATION Frankfurt, Germany · Remote
LANGUAGE German & English	VISIBILITY Internal system	METHODOLOGY Self-directed

RESPONSIBILITIES

- Setup app for commissioning new devices: Wi-Fi onboarding by QR code scan with a guided flow, device pairing and robust error handling.
- PWA dashboard for parents: follow, filter and review their children's play sessions.
- Later reconfiguration of paired devices through the same platform-independent PWA.
- Integration of **Supabase** for authentication, data storage and real-time synchronisation (including **row level security**).
- A fast PWA architecture (**Next.js**) with a responsive UI.
- CI pipeline (**GitHub Actions**) on top of containerised builds (**Docker**): unit tests (**Vitest**) and the build ran automatically on every change; deployment was done by hand.
- Definition and implementation of type-safe data models and API interfaces (**TypeScript**, **DTOs**, **Zod**).
- Close coordination in English with the hardware team to define the device-app communication and the setup protocols.
- Advising and guiding the client from the initial idea to an actionable **MVP** concept.

AITOI — INTERACTIVE IOT TOY (MVP) — CONTINUED

RESULTS

- A fully functional **MVP** frontend in ~2–3 weeks of actual working time — independently, from concept through client coordination to the demo.
- Setup app and parent dashboard as one platform-independent PWA, synchronised with the IoT device in real time.
- A scalable, documented architecture as a **solid** basis for the product launch.
- Trusted, cross-functional collaboration with the hardware team throughout the project — no friction at the device-app interface despite the tight schedule.
- The client's testimonial explicitly names the **CI/CD** pipelines and unit tests as contributing to the quality, security and reliability of the applications.

LEGALTECH / NOTARY

01/2025 – 05/2025 · 5 MONTHS

05

DiNo — Digital Notary Office

Role: Frontend Engineer Client: [LeXtorByte UG](#) ↗

↗ Testimonial

↗ Project on sequenz.io

ROLE Frontend Engineer	TEAM 2–4 people	LOCATION Oranienburg, Germany · Remote
LANGUAGE German	WEBSITE digitales-notariat.de ↗	METHODOLOGY Scrumban

RESPONSIBILITIES

- Digital case management across several portals: structured data capture, digital case files and seamless internal filing.
- Status tracking in the client portal (partial contribution).
- User guidance for notarial processes that need explaining — every step comprehensible without legal training.
- Interfaces for the notary and client portals with **React** and **Material UI**.
- Initiative within the codebase: introduced reusable components, refactored existing code and fixed long-standing bugs — aimed at solutions that hold up over time.
- Unified form validation (**React Hook Form**) to speed up feature development across the whole team.
- Close coordination with design and backend in a **Scrumban** rhythm, turning new requirements into usable interfaces quickly.

DINO — DIGITAL NOTARY OFFICE — CONTINUED**RESULTS**

- According to the provider, up to **70 %** fewer phone queries from clients.
- According to the provider, invoices are paid up to 30 days earlier.
- According to the provider, noticeably less administrative effort thanks to end-to-end digital processes.
- A consistent, modern UI across the client and notary portals, strengthening client trust and the notary office's efficiency alike.

RETAIL & AUTOMOTIVE TRADE

01/2024 – 12/2024 · 12 MONTHS · ONGOING MAINTENANCE (SIDE PROJECT)

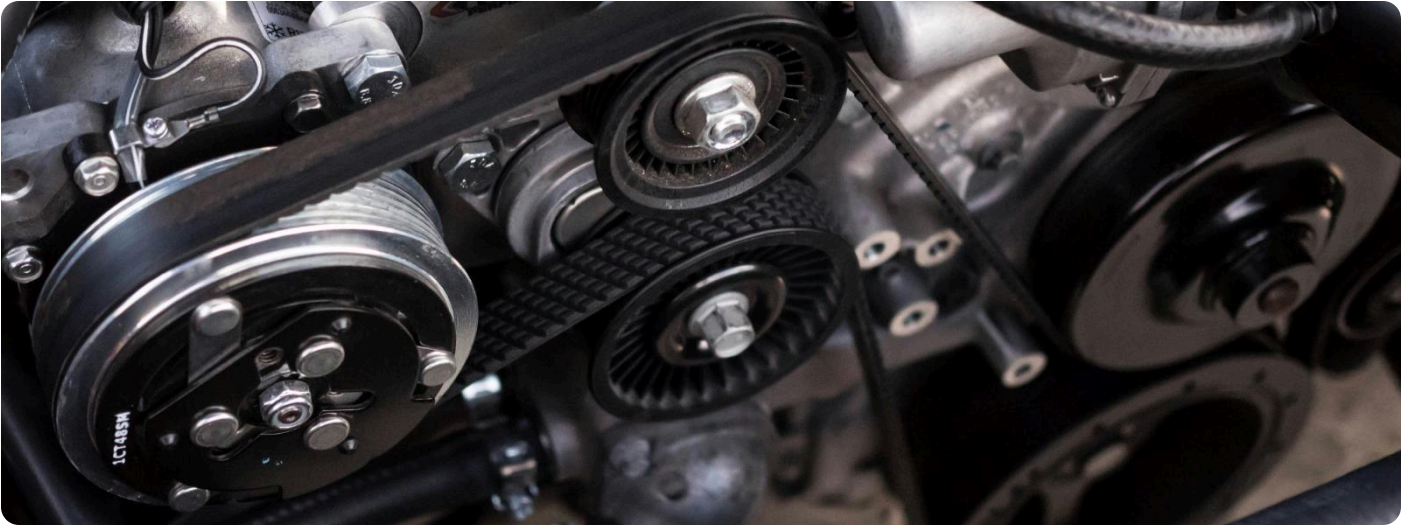

06

AccountingOS — GoBD-Compliant Accounting & Warehouse System

Role: Sole Developer · Full-Stack & AI Client: HD Autoservice

Testimonial

Project on sequenz.io

ROLE Sole Developer · Full-Stack & AI	TEAM Solo · client project	LOCATION Salzgitter, Germany · Remote
LANGUAGE German	VISIBILITY Internal system	METHODOLOGY Self-directed

RESPONSIBILITIES

- **Accounting** module: invoices, corrective invoices, PDF export, customer management, order import with **GoBD**-compliant record locking.
- Coupling of **warehouse management** and invoicing (automatic stock deduction, minimum-stock notifications).
- A resilient data synchronisation service ("pipe service") for supplier catalogues — up to 20 m CSV rows over TLS with a queue, caching, retry logic, validation and deduplication.
- Recursive resolution of foreign-key dependencies in the input dialogs, for consistent master data maintenance.
- Customer and **master data management** with **role-based access control** (admin, staff, tax adviser) and authentication via **better-auth**; type-safe **GraphQL** and REST interfaces (**NestJS**, **MikroORM**, **DTOs**).
- Technical advice for the client on approaches, architecture and process optimisation.
- Self-hosted delivery on **Linux** servers (**Docker**) with a **CI/CD** pipeline (**GitHub Actions**) and automated quality checks before every commit (Husky).
- Sole responsibility for the architecture (**clean architecture**), deployment and ongoing support (side project): maintenance, security updates and further development.

ACCOUNTINGOS — GOBD-COMPLIANT ACCOUNTING & WAREHOUSE SYSTEM — CONTINUED

RESULTS

- According to the client, up to 40 hours less administrative work per month — roughly 480 hours a year.
- According to the client, routine processes take up to **50 %** less time.
- End-to-end digital, **GoBD**-compliant workflows with warehouse and **accounting** directly coupled.
- In continuous operation since go-live: delivery, security updates and further development keep running automatically, without the client having to maintain an IT function for it.
- Daily automatic synchronisation of every supplier's car parts catalogue with **Accounting** OS — stock and prices are in place without a manual import.

LOGISTICS & TRANSPORT

02/2021 – 05/2023 · 2 YEARS 4 MONTHS · ONGOING MAINTENANCE (SIDE PROJECT)

07

Ladetrans — Truck Route Management for a Humanitarian Aid Organisation

Role: Sole Developer · Full-Stack & AI Client: [CDH Stephanus](https://cdh-stephanus.org) ↗↗ Project on sequenz.io

ROLE Sole Developer · Full-Stack & AI	TEAM Solo · client project	LOCATION Bremen, Germany · Remote
LANGUAGE German	WEBSITE cdh-stephanus.org ↗	METHODOLOGY Self-directed

RESPONSIBILITIES

- Loading lists per trip: goods to be shipped, recipient addresses and drivers assembled in a single case.
- Every trip as one continuous case — create, edit, close and archive.
- Automated generation of the route documents from the captured data, among other things for border checks.
- Audit-proof archiving of completed trips including the proofs uploaded at the end of each trip.
- Sole responsibility for the backend architecture (**NestJS**, **clean architecture**), **role-based access control** (**better-auth**) and the self-hosted deployment including ongoing maintenance (side project).
- Automated delivery of the self-hosted environment: **CI/CD** pipeline (**GitHub Actions**), containerised build (**Docker**) behind **Nginx** as a reverse proxy, quality checks before every commit (Husky).

LADETRANS — TRUCK ROUTE MANAGEMENT FOR A HUMANITARIAN AID ORGANISATION — CONTINUED

RESULTS

- According to the client, automated document processes save up to 1,000 hours per employee per year in trip handling — the route documents, previously assembled by hand for every trip, have since been generated from the captured data.
- According to the client, up to **30 %** higher **logistics** efficiency thanks to end-to-end management of the shipping trips.
- Markedly fewer transcription errors; every trip is archived audit-proof together with its documents and proofs.
- In continuous use for the aid transports since 2021 — self-hosted, with automated delivery and ongoing maintenance from one source.

↗ Testimonial

↗ Project on sequenz.io

ROLE Full-Stack Engineer	TEAM 5–10 people	LOCATION Bremen, Germany · Remote
LANGUAGE German & English	WEBSITE xu.de ↗	METHODOLOGY Scrum

RESPONSIBILITIES

- Course content (videos, podcasts, multiple choice, articles) that each tenant fills dynamically, served by clearly bounded services.
- Learning progress tracking including automatic certificate generation.
- Expert and community forums for exchange between participants and specialists.
- Full-stack development across all platform modules within an agile **Scrum** team — from course management to the certificate engine, in frontend and backend alike.
- Scalable backend services (**NestJS**, **GraphQL**) with clearly bounded domains in a microservice architecture.
- The learning platform's frontend in **Angular** (**Angular Material**, **NgRx**), delivered through **Azure DevOps** pipelines.

XU NAVIGATOR — ENTERPRISE LEARNING PLATFORM — CONTINUED

RESULTS

- A scalable microservice platform running in production at well-known corporations (VW, ThyssenKrupp and others).
- Tenant-specific course content: every corporation runs its own training on the same platform.
- Certificates are issued without manual rework, and learning progress can be evaluated per tenant.
- Close, cross-functional collaboration with product and design over two and a half years — from the first build-out to production use at several major clients.

Medical Device Management System

Role: Full-Stack Engineer Client: Hospital group

[Project on sequenz.io](#)

ROLE Full-Stack Engineer	TEAM 2–4 people	LOCATION Germany · On site / Hybrid
LANGUAGE German	VISIBILITY Hospital group (anonymised)	METHODOLOGY Scrumban

RESPONSIBILITIES

- Device and **master data management** (hospital, location, device specifications).
- Detailed maintenance history for every device (when work was done and what kind) plus device-related document management.
- Fault reporting by nursing staff as the entry point into the medical engineering maintenance process.
- Multi-tenant filtering by hospital, plus integration of the Microsoft sign-in via **O365 Identity**.
- **REST API** with **ASP.NET Core (Swagger/OpenAPI)**; data modelling with **Entity Framework Core** (code-first) on **MSSQL**.

MEDICAL DEVICE MANAGEMENT SYSTEM — CONTINUED**RESULTS**

- Multi-tenant device management for several hospitals — master data, maintenance history and document management per device in one place.
- Fault reports from nursing staff feed straight into the medical engineering maintenance process.
- A cleanly layered .NET architecture: code-first data model (**Entity Framework Core**, **MSSQL**), documented **REST API** (**Swagger/OpenAPI**) and authentication via **O365 Identity**.
- More than a year contributing within a small, closely aligned team on a safety-critical application in a hospital setting — with a focus on rigour, traceability and stable delivery.
